RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 168 pages. Dimensions: 9.7in. x 7.4in. x 0.4in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1908 edition. Excerpt: . . . when similarly placed in the path of a current of electricity has received careful experimental investigation. In this work the effort has naturally always been to ascertain what other peculiar chemical or physical properties electrolytic conductors have, besides the one of conducting the current with concomitant chemical decomposition, to which this latter power might be ascribed. The first systematic researches in this line were made by Michael Faraday, whose ingenious experiments are described in the volumes of his experimental researches. He showed that various fused salts and also solutions of different kinds may be electrolyzed, whereas other salts in the liquid state and other solutions are non-electrolytes. In connection with these experimental inquiries Faraday discovered his famous law, which lies at the basis of all electrolytic work; yet, though he gathered together a considerable number of facts as to what substances are electrolytic conductors and what substances are not, the question of the nature of electrolytes as contrasted with that of nonelectrolytes really remained untouched. Later, Hittorf, in connection with his work on the differences in concentration that occur at the electrodes during the process of electrolysis voiced the opinion that electrolytes are salts, using the latter term in its broader sense, of course, so as to include acids and bases. Why many salts are non-electrolytes, and why electrolytes should have salt-like character, was, however, not explained. Still later, Arrhenius made the claim that solutions showing greater diminution of the vapor tension, lowering of the freezing...
